# ALUMINA-ZIRCONIA *LATTICE FILTER*^{TM}

ROBOCASTING

DATA SHEET

Alumina-Zirconia lattice filters are both an engineered lattice structure suitable for molten metal filtration applications and an alternative to conventional ceramic filters. The repeating internal geometry of the lattice filter allows for precise control of flow rate and liquid-metal turbulence while maintaining the inclusion and dross filtration found in conventional ceramic filters. Thermal shock resistance and service temperatures in alumina-zirconia are extremely high. Reactivity with most metals is very low, making them ideal for iron, steel, copper, aluminum, and superalloys.

High-purity alumina-zirconia lattices are available in a range of sizes and internal lattice configurations (see sizing table) for many metals and thermal situations. Standard product sizes are 50–125mm (2–5 inches) in two grades of filtration with four flow rates per grade. Custom sizes, grades, and flow rates are also available.
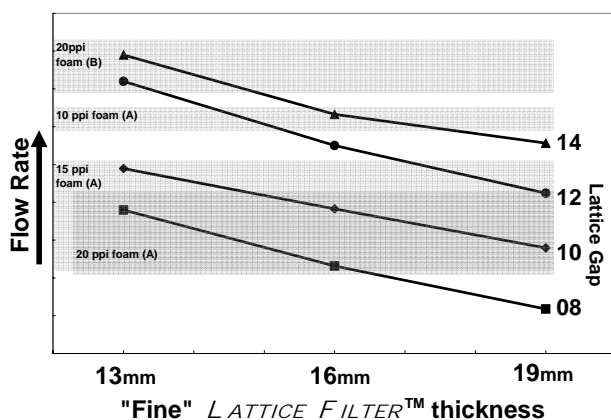

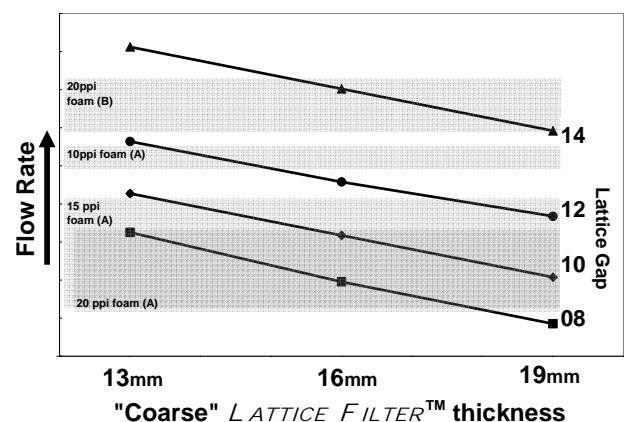

FILTRATION ADVANCEMENT

Consistency: Lattice filters are an engineered structure with repeatable cell size and orientation. As a result, flow rates are nearly identical (within 3%) between each filter. Further, filter efficiency is the same throughout the lattice with no areas of varying cell size or openness of porosity.

Efficiency: The liquid-metal flow is perfectly split as it passes through each layer of the lattice resulting in high filtration efficiency.

Strength: Filter friability is minimized due to the robust nature of the structure. The layerwise-manufacturing technique used to fabricate the lattices results in a strong, cohesive filtration product with no weak areas within the filter.

Capacity: Superior strength results in an increased liquid-metal-filtration capacity. Due to differences in liquid-metal cleanliness in different applications, capacities may vary.

Flow Rates: Lattice rod size and gap are controllable to very tight tolerances within the lattice resulting in consistent flow rates.

"Fine" *LATTICE FILTER*^{TM} thickness

"Coarse" *LATTICE FILTER*^{TM} thickness

Patent: US PATENT No. 6027326

REV001

LATTICE FILTER
